Template System Acceptance Checklist

Date: 2026-02-15
Source Guide: `docs/development/template-system-comprehensive-guide.md`

A. Scope and Baseline Verification

- [ ] Changes are limited to template-system related files and docs.
- [ ] No unrelated architecture or design-system changes were introduced.
- [ ] Source-of-truth guide and specs were used for validation.

B. Functional Acceptance

AC-1: Template catalog is complete and loadable

- [ ] `config/templates.json` parses successfully.
- [ ] All built-in template IDs are unique.
- [ ] Each template has required metadata and at least one executable script definition.

AC-2: Core service contract is implemented end-to-end

- [ ] `ITemplateService` operations are implemented by `TemplateService`:
  - [ ] load/search/get
  - [ ] apply
  - [ ] validate
  - [ ] compatibility
  - [ ] import/export custom templates
  - [ ] history

AC-3: Template execution pipeline works correctly

- [ ] Variable resolution order is correct and deterministic.
- [ ] Preflight checks execute before scripts.
- [ ] Required preflight failure blocks execution with actionable message.
- [ ] Ordered script execution is respected.
- [ ] `ContinueOnError` behavior matches metadata.
- [ ] Progress events are emitted during execution.

AC-4: Security and safety constraints are enforced

- [ ] Absolute script paths are rejected.
- [ ] Path traversal attempts are blocked.
- [ ] Script path resolution is limited to allowed roots.
- [ ] Cancellation and timeout handling are functional.

AC-5: Desktop wizard integration is operational

- [ ] Template selection step appears in install workflow.

- [ ] Template apply step executes after install phase.
- [ ] User selections (template + variables) are applied correctly.
- [ ] Apply errors are surfaced without crashing the wizard.

AC-6: PowerShell command surface is consistent

- [ ] Module manifest exports template cmdlets.
- [ ] `Get-DistroNexusTemplate` supports ID/category filtering.
- [ ] `Apply-DistroNexusTemplate` applies templates to target instances.
- [ ] `Invoke-DistroNexusTemplateAutomation` supports full and selective modes.

AC-7: Automation runner classification and artifacts are correct

- [ ] Runner returns correct `Pass` / `Fail` / `Blocked` statuses.
- [ ] Capability-gated templates can be excluded or marked blocked with reason.
- [ ] CI guard behavior matches policy (`skip by default unless override`).
- [ ] Run artifacts are generated:
  - [ ] XML report
  - [ ] run manifest JSON
  - [ ] markdown summary

AC-8: Built-in template coverage is aligned with current catalog

- [ ] Built-in templates are present across categories currently implemented:
  - [ ] `Development`
  - [ ] `Platform`
  - [ ] `CloudNative`
  - [ ] `Database`
  - [ ] `DataAndAI`
- [ ] Category gap status for `DevOps` target is explicitly documented.

AC-9: History and observability are available

- [ ] Application history persists to `%APPDATA%\DistroNexus\template-application-history.json`.
- [ ] Template execution logs/progress can be inspected during or after apply.

C. Non-Functional Acceptance

- [ ] Scripts are idempotent or include clear rerun safety constraints.
- [ ] Distro compatibility assumptions are declared and validated.
- [ ] Error messages are actionable for operators and contributors.
- [ ] Documentation reflects current implementation behavior.

D. Evidence Checklist

- [ ] Attach catalog validation output.
- [ ] Attach selective-run evidence (single template).
- [ ] Attach selective-run evidence (multiple templates).
- [ ] Attach full-run evidence (or reason not executed).

- ☐ Attach generated artifact paths under `docs/development/testing/results/`.
- ☐ Attach changed file list.

E. Sign-off

- Implementation Owner: _____
- Reviewer: _____
- Date: _____
- ☐ Pass [ ] Pass with Exceptions [ ] Fail
- Notes:
